

UPDATE...

SOFTWARE UPDATE 22.09.00

# HJ X-TRONIC

Update your Hans Jensen lubrication system with the latest software for improved trouble shooting features, updated interface and much more.

## Improve lubricator performance

The main purpose of this update is to improve the performance and support of your Hans Jensen lubrication system by introducing an operational log for changes in lubrication setup.

The new alarms log stores information for seven days on a number of parameters. This makes trouble shooting and support easier and faster. The graphic interface has also been modernized for an improved user experience.

## Flexible cleaning and login security

Besides the features list, the ACS function has also been updated now allowing flexible scheduling of the Automatic Cleasing Sequence algorithm. Finally, users get new passwords according to user roles and rights.

## Recommended update

We recommend this software update for vessels using HJ X-Tronic. Please contact our After Sales department for further information and scheduling a visit by our engineer.

## Benefits

- Operational transparency
- Easier trouble shooting
- Improve cylinder condition
- Improve login security

## Features

New operation log and troubleshooting tool:

- Operation log (registers all changes)
- Alarm log (feed rate, stroke, mech. stroke, fuel, rpm, and load)

Updated user interface showing graphs for:

- Graph for feed rate
- Graph for cylinder stroke
- Graph for RPM
- Graph for load
- Graph for fuel
